BLASTEC - Orica

Drilling and blasting is the controlled use of explosives and other methods such as gas pressure blasting pyrotechnics, to break rock for excavation. It is practiced most often in mining, quarrying and civil engineering such as dam, tunnel or road construction. The result of rock blasting is often known as a rock cut.. Drilling

The most serious problem with this type

of blasting is borehole accuracy. Key holes are usually diamond drilled or drilled with a Boart drill. If the boreholes are inaccurate, freezing of the muck can occur with re-drilling by remote as the only remedy for re-blasting. The calculation of void space can be expressed by the following equation;

based on bank cubic yards. This is rock in place. In blasting, you must drill deeper than needed to facilitate breaking the rock to grade. this extra drilling is called subdrill. Many contractors will try and charge for this. So, accepted practice is $(\text{length} \times \text{width} \times \text{cut depth})/27$. In regards to overburden.
