Differential Equations: some simple examples from Physclips

An ordinary differential equation (ODE) is an equation containing an unknown function of one real or complex variable x , its derivatives, and some given functions of x . The unknown function is generally represented by a variable (often denoted y), which, therefore, depends on x . Thus x is often called the independent variable of the equation. The term "ordinary" is used in contrast with the term ...

Differential equations of physics - Ole Witt-Hansen

Differential equations solving with Maxima. Let's see each lines in details. The first two inputs are the given differential equations written as $f(x, y) = 0$. In the third input, we create a list with all the equations, where we will add the two new definitions of $u(t)$ and $v(t)$ later. In the fourth and sixth, we define the $u(t)$ and $v(t)$ as the derivatives of the functions $x(t)$ and $y(t)$ respectively.

These lecture notes for the course APM 351 at the University of Toronto are aimed at mathematicians and physicists alike. It is not meant as an introductory course to PDEs, but rather gives an overview of how to view and solve differential equations that are common in physics. Among others, I cover Hamilton's equations, variations of the Schrödinger equation, the heat equation, the wave ...

Degree of Differential Equation. The degree of the differential equation is the power of the highest order derivative, where the original equation is represented in the form of a polynomial equation in derivatives such as y' , y'' , y''' , and so on.. Suppose $(d^2 y/dx^2) + 2 (dy/dx) + y = 0$ is a differential equation, so the degree of this equation here is 1.

Differential Equations. A Differential Equation is a n equation with a function and one or more of its derivatives:. Example: an equation with the function y and its derivative dy/dx . Solving. We solve it when we discover the function y (or set of functions y).. There are many "tricks" to solving Differential Equations (if they can be solved!).But first: why?

Differential Equations - Introduction - MATH

Differential equations are very common in physics and mathematics. Without their calculation can not solve many problems (especially in mathematical physics). One of the stages of solutions of differential equations is integration of functions. There are standard methods for the solution of differential equations.

Solving of differential equations online for free

Ordinary and partial differential equations appear in physics as equations of motion or of state. They are often linear differential equations for which a sum of solutions remains a solution. The solution of first- and second-order linear differential equations are obtained. The specification of linearly independent solutions using suitable boundary/initial conditions is discussed.
