## Distributed Systems Architecture

What is it. Distributed System Architecture allows multiple Experion® Process Knowledge Systems (PKS) to operate as one across multiple units, sites and facilities across the enterprise. This single integrated system enables seamless global access to data, alarms, alerts, interactive operator control messages and history across groups of systems.

## Distributed System Architecture - Honeywell

In distributed architecture, components are presented on different platforms and several components can cooperate with one another over a communication network in order to achieve a specific objective or goal. In this architecture, information processing is not confined to a single machine rather it is distributed over several independent computers.

Distributed systems generally fall into one of four different basic architecture models: Client-server —Clients contact the server for data, then format it and display it to the end-user. The end-user can also make a change from the client-side and commit it back to the server to make it permanent.
