Handbook Of Solitons Research Technology

In mathematics and physics, a soliton is a self-reinforcing solitary wave (a wave packet or pulse) that maintains its shape while it travels at constant speed. Solitons are caused by a cancellation of non-linear and dispersive effects in the medium. This book presents the research in the field.

Solitons such as these are solutions to the nonlinear Schrodinger equation in anomalous dispersion. Balancing the effects of dispersion and Kerr nonlinearity leads to a family of possible solutions, described by the soliton area theorem; the specific member of this family that is observed in a cavity is determined by the dissipative effects of gain, loss, saturable absorption, and spectral filtering (if applicable).

About Soliton We've spent over 25 million dollars over the past 5 years developing a breakthrough technology that dramatically accelerates the removal of tattoos. Our devices use very high energy, in the range of 3,000 volts at nearly 3,000 amps, to form acoustic shockwaves at 100 times per second.

A solitary wave is a localized "wave of translation" that arises from a balance between nonlinear and dispersive effects. In most types of solitary waves, the pulse width depends on the amplitude. A soliton is a solitary wave that behaves like a "particle", in that it satisfies the following conditions (Scott, 2005) :
