Analog television is the original television technology that uses analog signals to transmit video and audio. In an analog television broadcast, the brightness, colors and sound are represented by amplitude, phase and frequency of an analog signal.. Analog signals vary over a continuous range of possible values which means that electronic noise and interference may be introduced.

Composite video is an analog video signal format that carries standard-definition video (typically at 480i or 576i resolution) as a single channel. Video information is encoded on one channel, unlike the higher-quality S-video (two channels) and the even higher-quality component video (three or more channels). In all of these video formats, audio is carried on a separate connection.

Analog-to-digital converters (ADCs) are an important component when it comes to dealing with digital systems communicating with real-time signals. With IoT developing quickly to be applied in everyday life, real-world/time signals have to be read by these digital systems to accurately provide vital information. We'll take a dive into how ADCs work and the theory behind them.

A voltage regulator generates a fixed output voltage of a preset magnitude that remains constant regardless of changes to its input voltage or load conditions. There are two types of voltage regulators: linear and switching. A linear regulator employs an active (BJT or MOSFET) pass device (series or shunt) controlled by a high gain differential ampl

I was looking through this old thread about composite video cropping in the interest of creating my own analog 'video wall' type setup. I want to take in a single video signal and split it out to say 9 tvs. I was imagining splitting the signal and sending it to 9 modules that crop and zoom the incoming signal so only a section of the video plays on each tv.
