The radiobiology of high dose rate introduces the concept of fractionation into brachytherapy but with increasing use and familiarity of standard schedules the initial uncertainty that surrounded this approach is rapidly fading. The other major development in brachytherapy in

This review evaluates whether brachytherapy can be considered as an alternative to whole breast irradiation (WBI) using criteria such as local recurrence rates, overall survival rates and quality of life (QoL) factors. This is an important issue

Get Free Radiotherapy In Practice Brachytherapy

because of a decline in local recurrence rates, suggesting that some women at very low risk of recurrence may be incurring the negative long-term side effects of WBI without benefitting from a reduction in local recurrence and greater overall survival.

A literature review of the role of brachytherapy in the

Get Free Radiotherapy In Practice

High-dose-rate (HDR) brachytherapy allows a person to be treated for several minutes at a time with a powerful radioactive source that's put in the applicator. The source is removed after 10 to 20 minutes. This may be repeated twice a day over a few days, or once a day over the course of a few weeks.

Radiotherapy in Practice - Peter J. Hoskin - Oxford ...

Currently, there are
two IVD methods that

Get Free Radiotherapy In Practice

could be used with brachytherapy. One involves locating a radiation detector inside the applicator itself. While this approach can identify a variety of errors, it cannot detect movement of the entire applicator with respect to the patient, which would generate serious dose errors.
