A widely used semi-empirical tire model to calculate the steady-state tire force and moment characteristics for use in vehicle dynamics studies is based on the Magic Formula. The Magic Formula  $y(x)$  typically produces a curve that passes through the origin  $x = y = 0$ , reaches a maximum, and subsequently tends to a horizontal asymptote.

A tire (American English) or tyre (British English; see spelling differences) is a ring-shaped component that surrounds a wheel's rim to transfer a vehicle's load from the axle through the wheel to the ground and to provide traction on the surface over which the wheel travels. Most tires, such as those for automobiles and bicycles, are pneumatically inflated structures, which also provide a ...

We develop and test a "slip-based" method to estimate the maximum available tire-road friction during braking. The method is based on the hypothesis that the low-slip, low- $\mu$  parts of the slip curve used during normal driving can indicate the maximum tire-road friction coefficient,  $\mu$  max. We find support for this hypothesis in the literature and through experiments.
